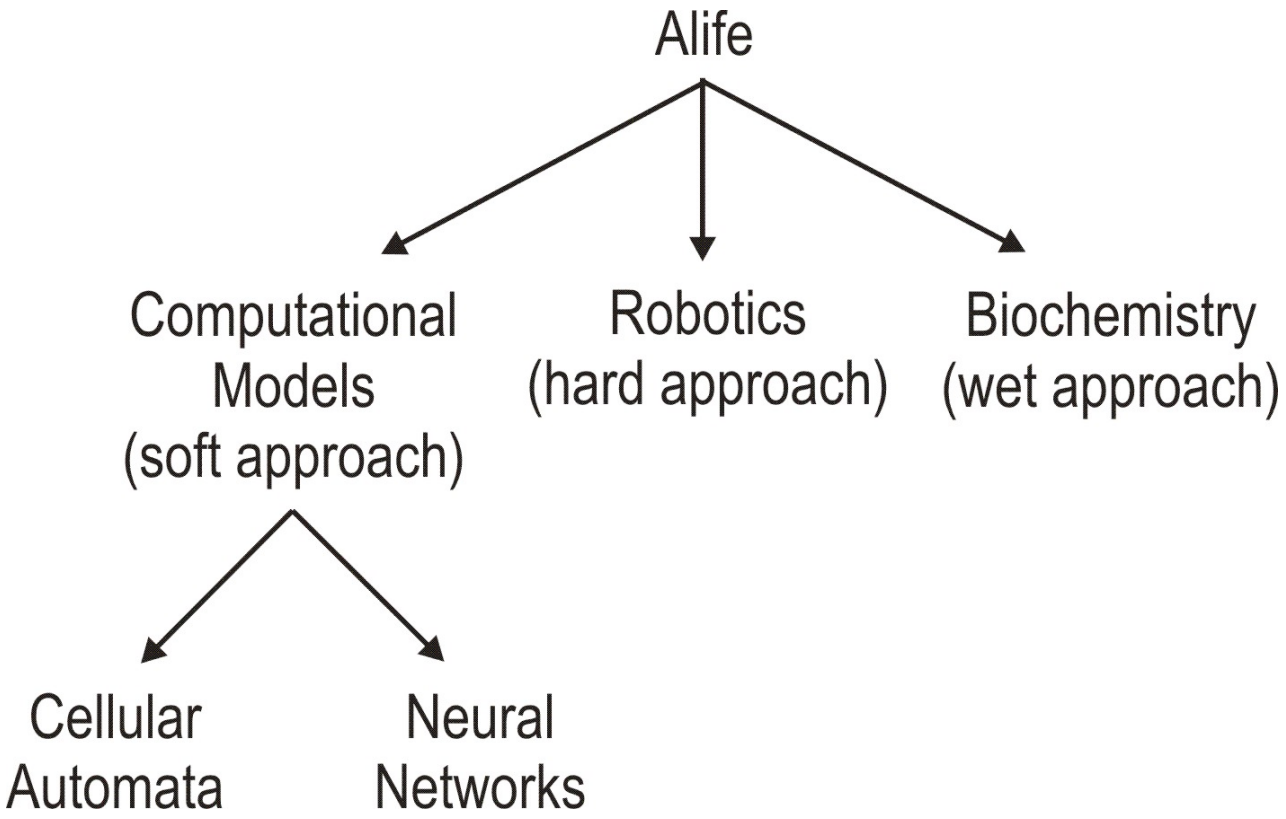
Lecture Overview

- What is Alife
- Brief history – timeline
- Synthetic Ethology and Food Chains
- Example: Food Chain model
  - Agent Anatomy
  - (Pseudo-) code
  - Sample iteration
  - Results
  - Observations
- Reference List

What is Alife ?

- Alife [Langton] is set of mechanisms used to model and simulate evolving natural systems
  - Insect ecologies, animal behavior, negotiating entities, resource use in artificial economies
  - Studies the evolution of agents, or populations of computer simulated life forms in artificial environments
  - Complements traditional biology by trying to *recreate* biological phenomena

What is Alife ?



- Traditionally AI: a top down approach
- Alife: works from the bottom up

Brief history - Timeline

Jacques de Vaucanson
(1739, pre-computer)
Artificial Duck

↓

John Von Neumann
(late 1940s)
Theory of automata
Self-replicating Machine

↓

Homer Jacobson
(1950s)
Illustrated basic self-replication with a model train set

↓

John Horton Conway
(1960s)
The Game of Life
(Most famous cellular automaton)

↓

Edgar F. Codd
(1968)
Simplified Von Neumann's Cellular automaton from 29 states to 8 states

↓

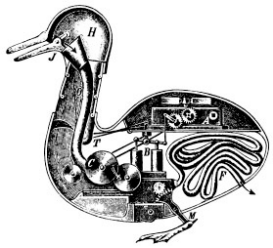
Christopher Langton
(1979)
First self-replicating computer organism using only an Apple II desktop computer
(1989)
Founder of Artificial Life

↓

Stephen Wolfram
(1982)
1-D Cellular Automata applied to natural phenomena (seashell patterns, plant growth)

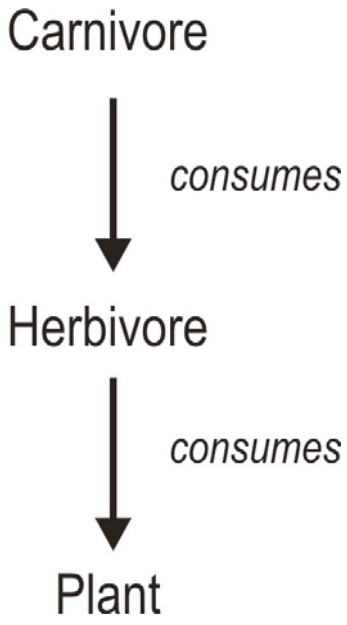
↓

The Unit of Theoretical Behavioural Ecology
Free University of Brussels
(mid 1980s)
Self-organization theories to research the behavior of social insects



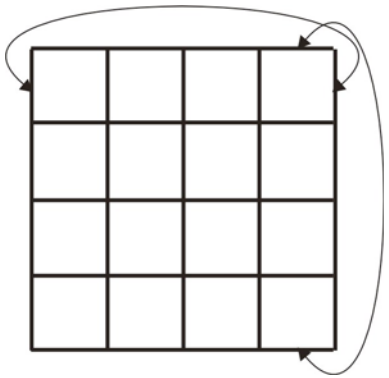
Synthetic Ethology & Food Chains

- Synthetic Ethology
  - Study of animal behavior in which simple, synthetic organisms are allowed to behave and evolve in a synthetic world.
  - Branch of zoology
- Food Chain
  - Describes the hierarchy of living organisms within an ecosystem.

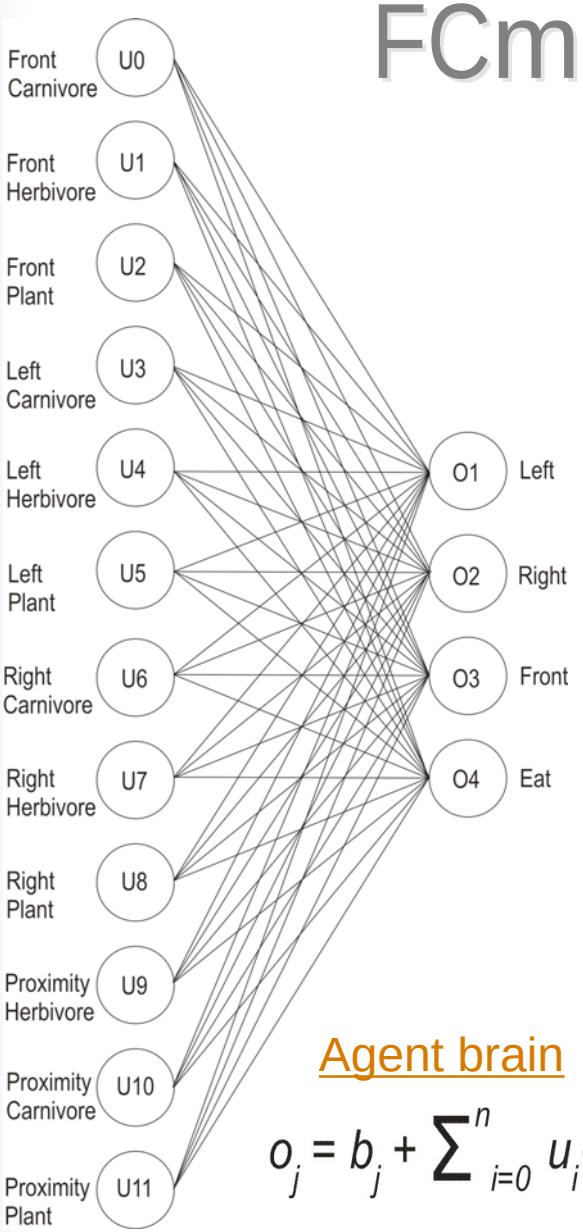


Example: Food Chain Model (FCm)

- 3 Entities
  - Plants:
    - Fixed location, consumed by herbivores
  - Herbivores:
    - Migratory agents, eat plants, eaten by carnivores
  - Carnivores:
    - Migratory agents, eat herbivores, die from starvation
- Environment
  - Toroid grid
  - Each cell occupied by one or more agents

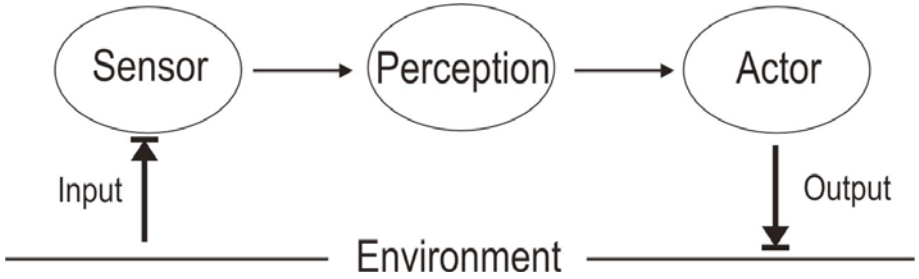


FCm: Agent Anatomy



Agent brain

$$o_j = b_j + \sum_{i=0}^{n} u_i \cdot w_{i,j}$$



The Agent

Agent perception of the environment

FCm: Agent "Life & Death issues"

- Energy (*E*) / Metabolism
  - Eat → *E = E + 1*
  - For each step → *E = E – X*, (*H: X=1, C X=2*)
  - If *E == 0* → Die
- Reproduction
  - If *E > 90%* → Reproduce asexually
  - Lamarckian: Offspring inherits parents' NNet followed by random mutation of weights
- Death
  - Starvation (no food found)
  - Eaten (only for herbivores

FCm: The (pseudo-) code

```
Main ( )
    Init ( )
    while (run < MAX_RUNS)
        SimulateOnce ( )

Init ( )
    landscape := InitLandscape ( )
    GrowPlants ( landscape [plants] )
    while ( agents < MAX_AGENTS )
        agent := CreateAgent ( )
        if ( agent.type == herbivore )
            PositionAgent ( landscape [herbivores] )
        else
            PositionAgent ( landscape [carnivores] )
```

FCm: The (pseudo-) code

```
SimulateOnce ( )
    forall agent types
        foreach agent
            PerceiveEnvironment (agent)
            ForwardPropagateInputs (agent.Nnet)
            ComputeAction (agent)
        switch (agent.action)
            case TURN_LEFT:
            case TURN_RIGHT:
                agent.direction := UpdateOrientation (agent)
            case MOVE_FRONT:
                agent.position := UpdatePosition (agent)
            case EAT:
                Eat (agent)
```

FCm: The (pseudo-) code

```
...
    UpdateEnergy (agent, agent.action)
    if agent.energy  == 0
        KillAgent (agent)
    else
        agent.age += 1
    if agent.energy > REPRODUCTION_LEVEL
        ReproduceAgent ( agent )
```

FCm: The (pseudo-) code

```
GrowPlants ( )
    location := SelectRandomLocation (landscape [plants] )
    if no plant in location
        landscape [plants] [location.x] [location.y] := 1

CreateAgent ( )
    agent.energy := MAX_ENERGY / 2
    agent.age := 0
    agent.generation := 1
    agent.type := carnivore | herbivore
    foreach neuron in Nnet
        SetWeight (neuron)
```

FCm: The (pseudo-) code

```
PositionAgent ( )
    location := SelectRandomLocation (landscape [agent.type])
    if no agent in location
        landscape [agent.type] [location.x] [location.y] := 1
    agent.direction := SelectRandomDirection ( )

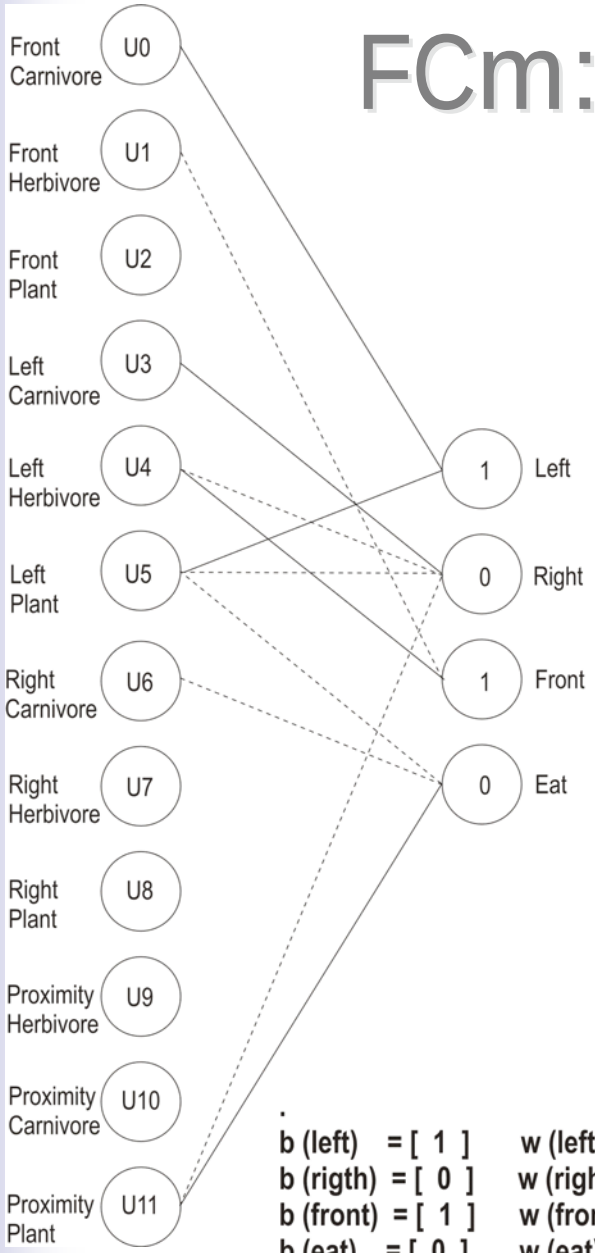
Eat ( )
    if agent.type == CARNIVORE
        UpdateLandscape ( landscape [herbivores] )
    else
        UpdateLandscape ( landscape [plants] )
```

FCm: The (pseudo-) code

```
KillAgent ( )
    UpdateLandscape ( landscape [agent.type] )
    if num of agent of this type < MAX_AGENTS / 4
        CreateAgent ( )

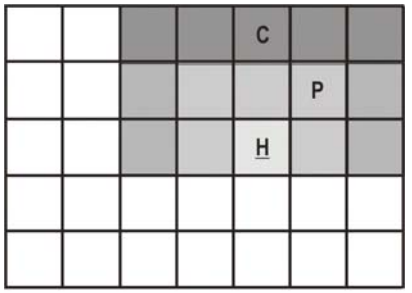
ReproduceAgent ( )
    if num of agents of type < MAX_AGENTS / 2
        // Inheritance of NNet in offspring
        new_agent := DuplicateAgent ( agent )
        // Randomly mutate neuron weights
        foreach neuron in new_agent.Nnet
            if mutation_probability > 50%
                SetWeight (neuron)
        PositionAgent ( landscape [agent.type] )
```

FCm: A sample iteration



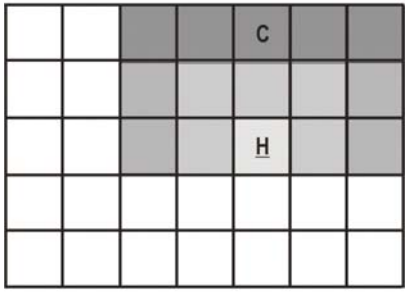
inputs = [0 1 0 0 0 0 0 0 0 0 0 1]

outputs left = 1 right = -1 front = 0 eat = 1



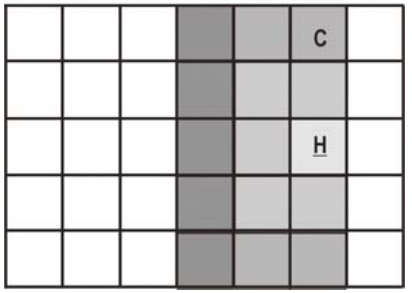
inputs = [0 1 0 0 0 0 0 0 0 0 0 0]

outputs left = 1 right = 0 front = 0 eat = 0



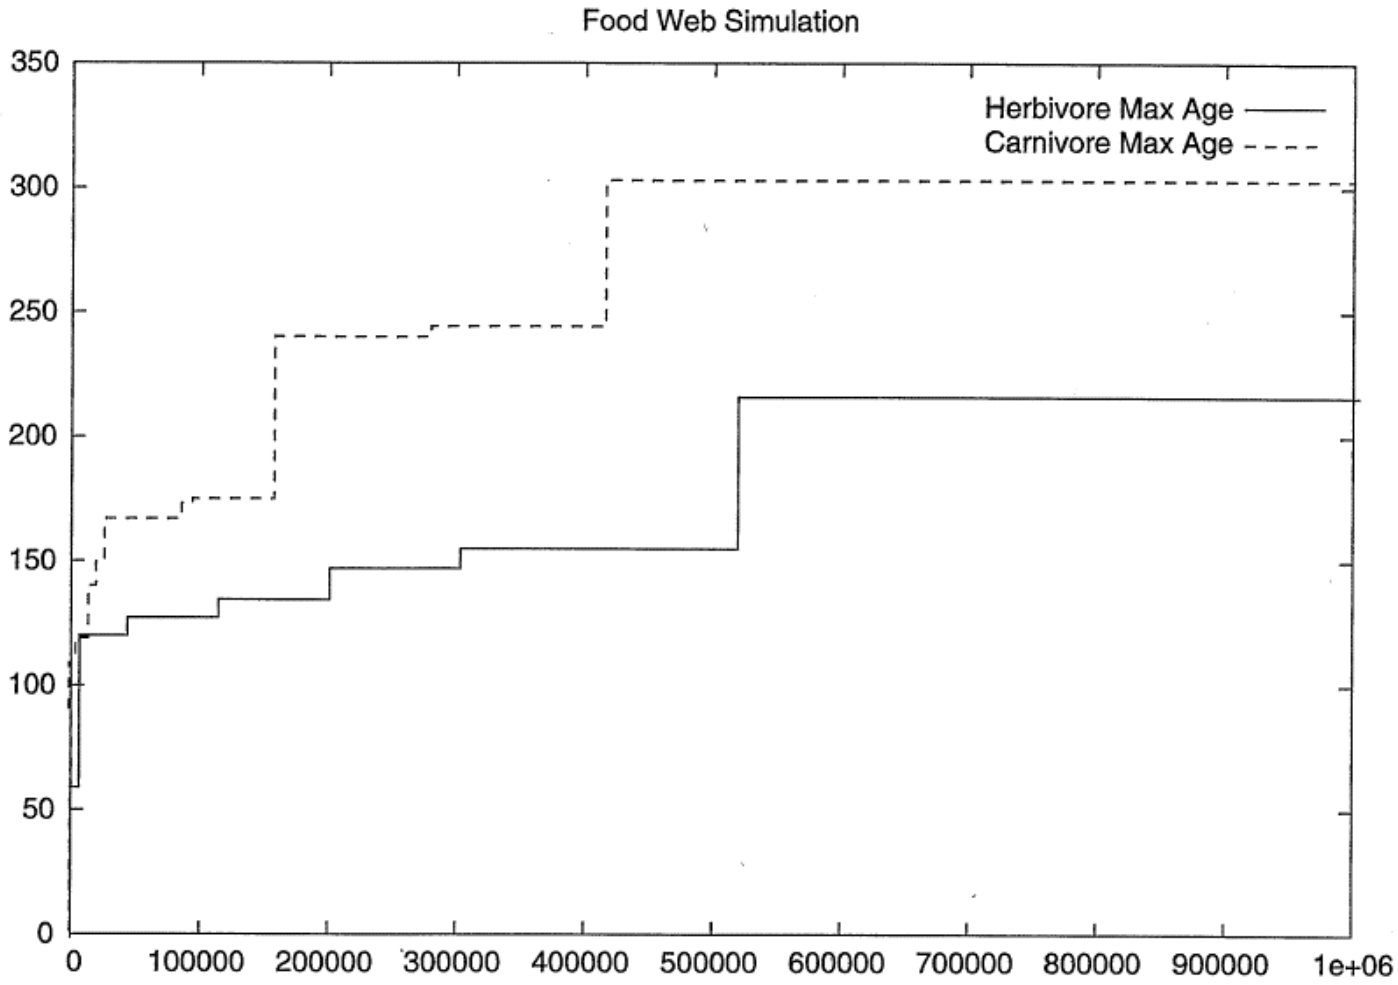
inputs = [0 0 0 0 0 0 0 1 0 0 0 0]

outputs left = 1 right = 0 front = 1 eat = 0

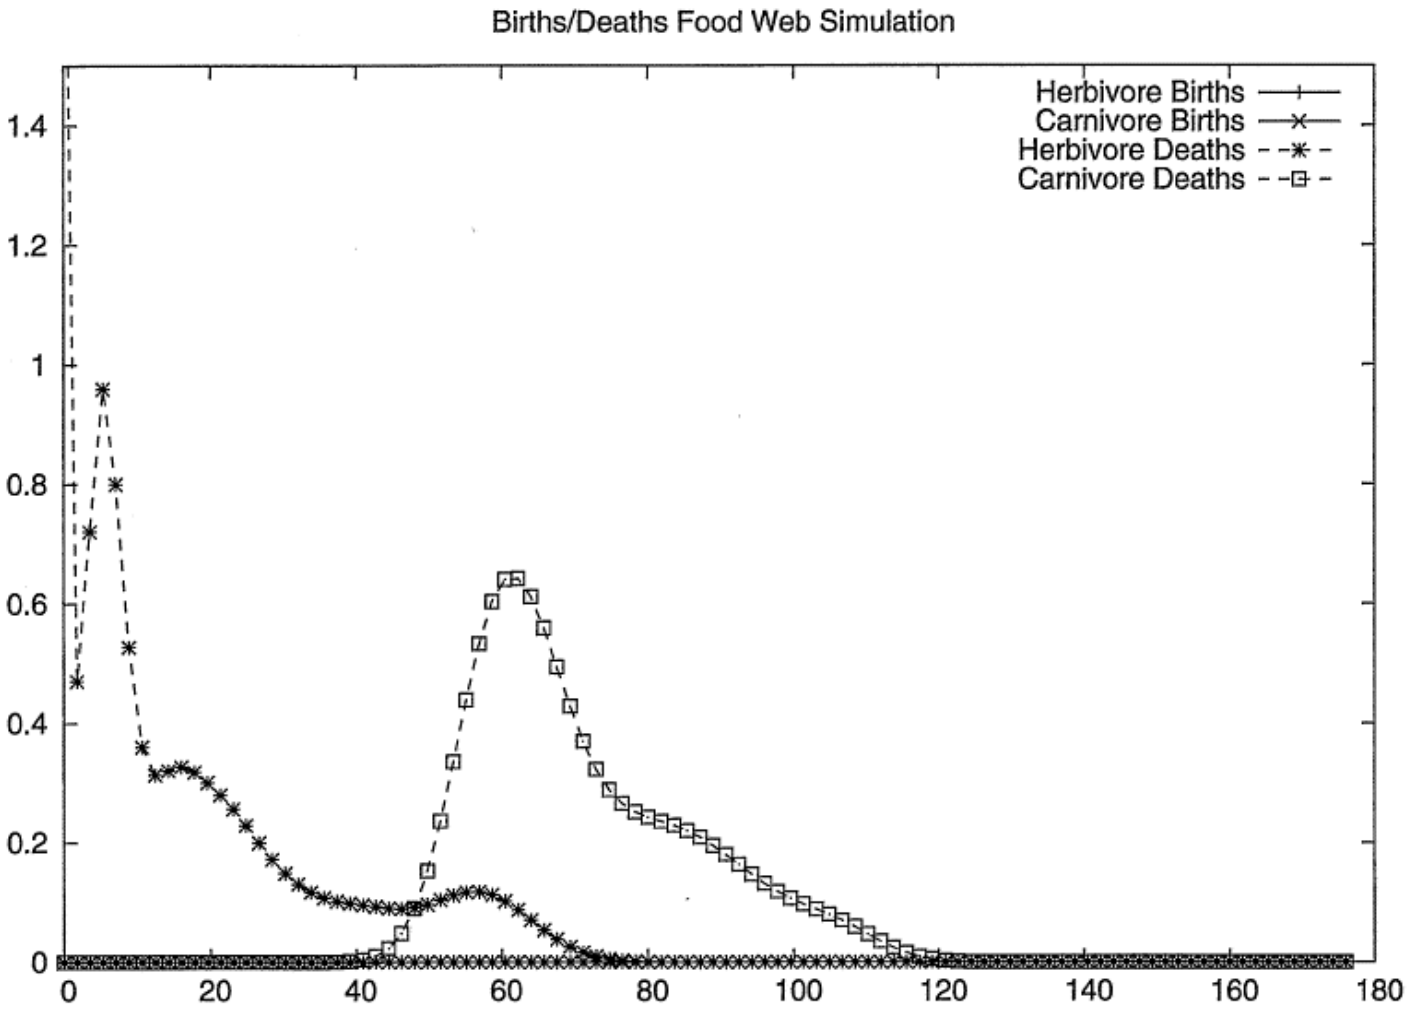


.	HF	CF	PF	HL	CL	PL	HR	CR	PR	HP	CP	PP
b (left) = [1]	w (left) = [1	0	0	0	0	1	0	0	0	0	0	0]
b (rigth) = [0]	w (right) = [0	0	0	0	-1	-1	0	0	0	0	0	-1]
b (front) = [1]	w (front) = [0	-1	0	0	1	0	0	0	0	0	0	0]
b (eat) = [0]	w (eat) = [1	0	0	0	0	-1	-1	0	0	0	0	1]

FCm: Simulation Results



FCm: Simulation Results



FCm: Observations and Conclusions

- Competition
  - Carnivores evolve NNets, good at locating and eating herbivores
  - Herbivores evolve NNets that find plants and avoid carnivores
- Evolved Strategies
  - Herding: Herbivores follow other herbivores in front
  - Ambushing: Carnivores find plants and then wait for herbivores to wander by

FCm: Observations and Conclusions

- Parameters tuning
  - Number of plants >= number of herbivores
  - Number of agents must be small so as not to crowd the simulation
  - Number of carnivores <= 2 * Number of herbivores
